New Scientific Discovery of Utmost Importance to Lawn Makers

Outstanding among the scientific discoveries in recent years is proof of the existence of plant hormones and their tremendous importance to plant growth. Extensive studies and experiments by scientists have shown that certain complex chemical substances exert upon the plants the same effect as the true plant hormones, the chemical nature of which still goes unsolved.

First applied for inducing root development on cuttings, their stimulating effect upon seed germination became evident soon after. During the course of such experiments a very decisive hormone influence on grass seeds was observed—a finding of utmost importance to all lawn makers.

Dreer's Lawn Grass Seeds are Hormone-Treated at No Increase in Price

Checking the results of our own experiments with those of other investigators we came to the conclusion that Dreer customers should have the immediate benefit from this sensational new discovery.

Be among the first to see for yourself just what Dreer’s Hormone-Treated Lawn Grass Seed will do for you whether you start a new lawn or reseed the one you now have.

The Hormone Treatment of Dreer's Lawn Grass Seeds induces quicker germination and more vigorous growth. The effect is most marked upon the roots of the young plants and, as every gardener knows, an extensive, well-developed root system is the foundation for a successful lawn able to withstand seasonable adversities and diseases.

Even with hormone treatment thorough soil preparation still is very important. Dreer’s Hormone-Treated Lawn Grass Seed will make its best showing if sown in well-prepared, well-fertilized soil and given good care such as proper watering, etc.

Hyacinths are perfectly hardy in the United States and Canada coming into bloom outdoors at the same time as the midseason Tulips. The bulbs must be planted in the fall to bloom the following spring. In the garden place the base of the bulbs 5 to 6 inches below the soil level. Besides their value for garden display they are exceedingly popular for growing as winter-flowering plants in the house. For this purpose they may be grown in pots, pans, or in glasses filled with water.

carefree natural arrangement of such borders. There is hardly a
garden where several dozen of these mixed garden Hyacinths
could not be used to great advantage.

These are somewhat tender, not recommended for outdoor
planting in the north, but they are of utmost value for forcing
in the house. Their loosely formed, delicately perfumed flower
spikes will give a splendid display from November until April if
succession plantings are made a week or ten days apart. They
may be grown in either soil or bulb fiber starting them in a
moderately cool but frostproof room.

Virginia
The Blue Roman Hyacinth

A showy variety for growing indoors. Virginia has much
larger bells and a longer stem than the White Roman. It will
produce 2 to 3 beautiful spikes to the bulb. May easily be
grown in the house for blooming at Christmas or any time
afterwards. It combines the habit of Early White French with the
color of a very fine porcelain blue Dutch Hyacinth.

Treasure Chest of Hardy Flowering Bulbs
That Bloom During Spring, Summer, & Fall

Hardy bulbs bring to our gardens a wealth of colorful flowers. All of them are easy to grow and those which flower during the early spring are particularly welcome. Though they are small they are truly beautiful. Take for example the Snowdrops, Chionodoxa, or Crocus that greet us soon after the last of the snow has melted. Scillas and Grape Hyacinths continue the procession with Fritillaria, Lily of the Valley, Anemone, Calochortus, Erythronium, Leucojum, and Ranunculus providing a succession that leads up to the early summer-flowering plants. For blooming this fall plant Colchicum and Fall-Flowering Crocus without delay.

Glorious Bulbous IRIS
DUTCH, SPANISH, & ENGLISH

These Hardy Iris must be planted in the Fall

Iris will give your garden a maze of sparkling splendor—and is the garden really complete without these dainty touches of color?

These Iris differ from the Bearded and Japanese by producing bulbs instead of rhizomes. These must be planted in the fall, the earlier the better and they have proved quite hardy. Where winters are very severe they should be covered deeply with straw, hay, or leaves. Excepting the English Iris they form foliage in the fall with the leaves persisting throughout the winter. Cover the bulbs 4 to 6 inches deep.

Give your home an atmosphere of cozy charm with a few well chosen shrubs.
A few dollars spent for some of the rarer shrubs will add an air of serenity and
restfulness that will give distinction to your home grounds. Late autumn is
the ideal time to plant shrubs. They usually can be dug after the middle of
October and where frost enters the ground previous to that time a few burlap
bags, hay, straw, or manure will keep the soil workable until the plants arrive.

As growth varies according to conditions we give the approximate height as
follows: D=Dwarf (less than 4 feet tall); M=Medium (4 to 8 feet tall; 
T=Tall (8 feet and more).
